

Papusha Rocket Technology ICO is a symbiosis of unique space technologies with no analogues in the world!

Use and Prospects of the PRT Token

The world's first rocket and space technology to produce fuel by using coal and fuel oil residues offered by Anatoly Papusha, the academician of the Russian Academy of Natural Sciences who developed the *Buran* program

To understand the value of the PRT token, as well as the prospects for its growth, it is necessary to collect all necessary data.

The PRT-2 unit with the smallest power is taken as a basis:

- The cost price –USD 450,000,
- The sale price –USD 950,000, and
- Net profit from one PRT unit – USD 2,500,000.

This unit recycles 30 tons of residues per day. Taking into account the required maintenance, the unit works on average 250 days a year. The annual processing of residues is 7,500 tons.

Every day refineries generate 1.35 million tons of residues worldwide or 500 million tons annually. Thus, as estimated, it is necessary to have about 70,000 PRT-2 units.

It is important to mention that it goes about recycling of new residues only, which allows not to additionally pollute our planet. Processing of the accumulated deposits and lakes requires the volume that is several times higher than this.

In the calculations below, we take into account the fact that the market is entirely free, because there is no analogous offer at all.

Binding the PRT token to PRT-2 units

The company has created a simple token binding that is understandable for investors, with a continuous growth potential. For each PRT-2 unit sold, 15% of the sales amount goes to the "liquidity fund". The company undertakes to transfer this amount from the liquidity fund for the purchase of tokens from the market and burn them within the next 3 months (since the sale).

15% of USD 950,000 is USD 142,500. This does not affect the company's work, taking into account the net profit from every sold unit in the amount of USD 500,000

FAQ:

Do you send 15% of the profits to the liquidity fund?

No, we send to the fund 15% of the money (dollars, euros, etc.) from each unit sold. This decision is taken exclusively in the interests of our investors. Since the promise to redeem tokens from the future profits cannot be transparent. Moreover, there physically cannot be any profit if the company expands production. In this case, investors are sure that as soon as PRT-2 units are sold, we immediately reserve 15% of this amount in the liquidity fund.

Why is it not possible to buy tokens from the market the next day after selling the PRT-2 unit? What is the reason to prolong this process for 3 months?

The PRT token is intended for the investments made in the real business. We do not welcome its increased volatility. For example, one day we can sell 5 units, and 150 ones on the other day. If to immediately enter the market with such additional demand, it will sharply move the PRT token price up.

That is why money is accumulated in the liquidity fund, and tokens are redeemed from the market at optimal times, with small volumes in order not to move the price much. For example, one of the best moments is the day when the entire cryptocurrency market falls. Consequently, we can try to buy some of the tokens by limit orders rather than by the market.

How can I learn about the exact number of PRT-2 units sold?

These units are purchased by refineries all over the world. Every sale demands to conclude a contract and to prepare a lot of documents. As soon as our company receives money to its account, another sale is announced on our website, and the money is added to the liquidity fund. The exact amount of the latter like the number of the units sold is posted publicly on our website. This is also additional advertising (the fact of each sale) that attracts even more new customers.

Table of the PRT token movement

It is based on the following data:

- The selling price for the PRT-2 unit is USD 950,000.
- From each sale \$142,500 is sent to the liquidity fund.
- The total number of tokens in the amount of 100 million is USD 10,000,000.
- The price of the token (this value is used to simplify calculations) is \$0.1.

YEAR	NUMBER OF PRT-2 SALES (PCS.)	PURCHASE OF TOKENS FROM THE MARKET (MLN. USD)	PRT TOKEN PRICE (USD)
			0,1
1	200	28,5	1
2	1 000	142,5	15
3	5 000	712,5	300

Thus, selling 6,200 PRT-2 units for 3 years, which is only slightly more than 7% of the market's needs, we will send USD 883 million to buy tokens from the exchange and increase its price supposedly 3,000 times.
